

The Power of Compound Interest

This document compares two investors to demonstrate the importance of starting early: - Investor A starts at age 25, investing 10M KRW per year for 20 years. - Investor B starts at age 40, investing 50M KRW per year for 20 years. - Both assume a 12% annual return. Even though B invests a much larger amount, A ends up with greater wealth thanks to the power of compound interest over a longer time horizon.

Age	A Wealth (100M KRW)	B Wealth (100M KRW)
25.0	0.1	0.0
